

① Contains duplicate.

Given  $\rightarrow$    $\rightarrow$  array

Output  $\rightarrow$  true/false  $\rightarrow$  if array contains duplicates.

means something was removed  
so there was duplicate in array.

## ② Valid Anagram -

Given  $\rightarrow S_1, S_2$

Out  $\rightarrow$  Anagrams or not  $\rightarrow$  true/false

Create freq. Map of each string

racecar

car race.

r	2
a	2
c	2
e	1

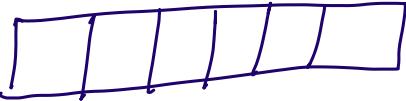

c	2
a	2
r	2
e	1

Compare

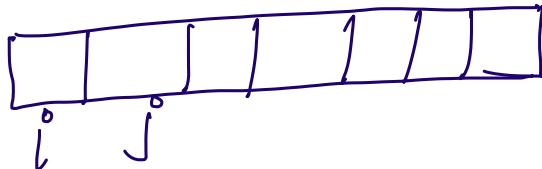

they are same  $\rightarrow$  true

otherwise  $\rightarrow$  false.

### ③ Two sum -

Given  $\rightarrow$   & targetSum.

output  $\rightarrow$  indices  
which makes targetsum.

check if  $arr[i] == arr[j]$   
if yes return  $\{i, j\}$

for every  $i^{\circ}$   
check  $j^{\circ}$ .

for ( $i = 0 \rightarrow i < n-1$ )

for ( $j = 0 \rightarrow j < n-1$ )

④ Group anagrams.

We take every string & sort it.

Sorted String	Normal String

Hashmap

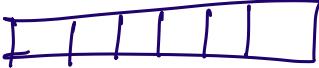

if string - matches sorted string

add the normal version.

We match every string by sorting it so that we could find anagrams.

Return all values as list.

⑤ Top K frequent elements.

Given →  TOP → 2.

arr = [1, 1, 2, 2, 2, 2, 3, 3, 3]

No	freq.
1	2
2	4
3	3 ..

Hashmap

min heap of size TOP

size - 2	
1, 2	.

Pq

size - 2	
1, 2	2, 4

Pq

size - 2	
2, 4	3, 3

Pq

| 1, 2 | ←  
← poll

⑥ encode & decode strings -

[Neet, Code, love, you].

encode. → length + # + string

4#Neet 4#Code 4#love 3#you

decode. →

4#Neet 4#Code 4#love 3#you

↓  
parseInt  
4  
 $i = hash + 1$

substring ( $i, i + \text{length}$ )  
substring ( $2, 2 + 4$ )  
substring ( $2, 6$ ) → Neet.

⑦ Product of array except itself.

→ Given →

The diagram illustrates an array transformation. On the left, under the label "input", is a horizontal box containing four cells with the values 1, 2, 4, and 6. An arrow points to the right, leading to the "output" section. In the "output" section, there is a larger horizontal box containing four cells with the values 48, 24, 12, and 8. The entire "output" box is underlined.

let arr = [1, 1, 2, 8] multiplication from left.

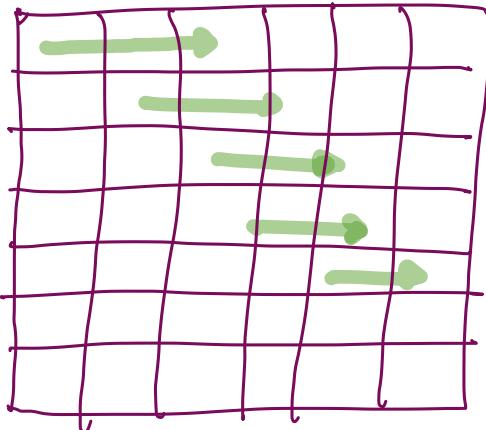

sight arr  $\rightarrow$  [48 | 24 | 6 | 1] multiplication from right

result → 

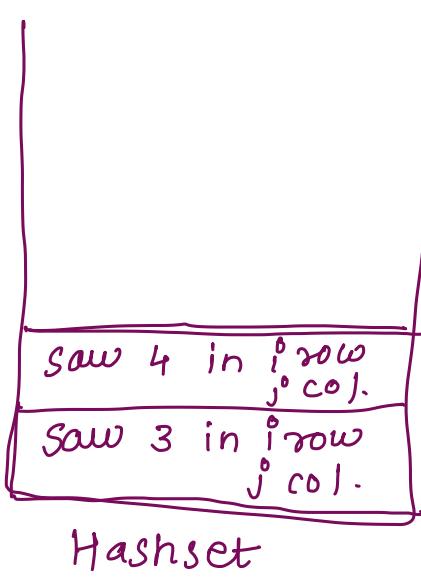

48	24	12	8
----	----	----	---

 multiplication of left[i<sup>0</sup>] \* right[i<sup>0</sup>].

## ⑧ Valid sudoku

traverse matrix

→ we keep adding strings with No & its row & col.

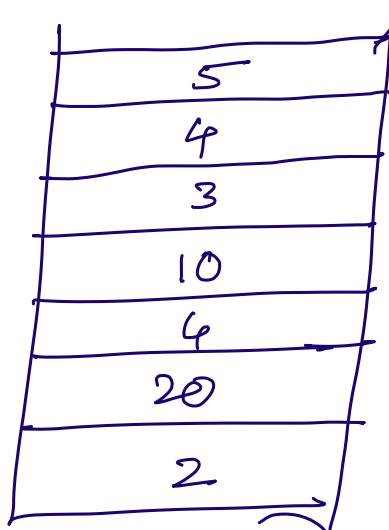

if we see the same number in same row or same col or even diagonally  
we return false -

for diagonal we use  $i/3$  &  $j/3$ .

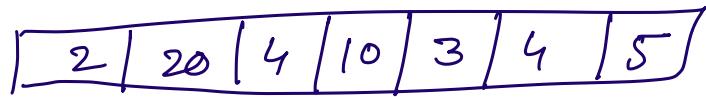

⑨ longest consecutive sequence.

Given  $\rightarrow$  [ ] [ ] [ ] [ ]  $\leftarrow$  Non sorted

put everything in hashset for constant access

Now we traverse array

② do we have 3 in hashset.

2  $\rightarrow$  3  $\rightarrow$  do we have 4.

2  $\rightarrow$  3  $\rightarrow$  4 do we have 5

2  $\rightarrow$  3  $\rightarrow$  4  $\rightarrow$  5  $\xrightarrow{\text{do we have 6}}$

longest till now would be 2-3-4,5,

we only start counting length  
when we don't have n-1 numbers

e.g

we got '4' in array

we only start counting it there does  
not exist 3.

If 3 exist, we would start by '3' in  
future.
